DISTRIBUTOR OPERATIONS BULLETIN

Subject: Groundsmaster 4500-D Crosscut Position Kit (Model 30832)

A new kit has been released, GM 4500-D Crosscut Position Kit (Model 30832). With this kit installed on any GM 4500-D model, the operator will be able to raise the cutting units up to a crosscut or turnaround position (Figure B) rather than the higher transport position (Figure A).

This kit can be mounted on a GM 4700-D unit but the outer two wing decks will not be controlled by the crosscut position kit. The operator will need to raise the 2 rear wing units with the existing lift/lower levels.

Below is an excerpt from the installation instructions of model 30832 describing the operation of the crosscut position kit:

Operation

Transport Position

Pull back on the “Raise” joystick while pressing down on the pedal to raise the cutting decks to the transport position (Figure A).

Crosscut or Turnaround Position

Pull back on the “Raise” joystick and **do not** press down on the pedal to raise the cutting decks to the turnaround position (Figure B).
